6. Conclusion

The TIA-9.72 framework bridges the gap between systematic efficiency and human macro-intelligence. By rigorously proving its unoptimized edge through a 6-year walk-forward validation (2020–2025), utilizing six sequential folds of 3-year in-sample training and 1-year blind out-of-sample testing, the model demonstrates profound structural resilience across varying macroeconomic environments. Coupled with a rigid 15% per-asset risk cap and the CIO's mandate to curate a non-correlated, swap-positive portfolio while actively compressing realized drawdowns, TIA-9.72 represents a highly scalable, institutional-grade allocation vehicle.
